

Portfolio Five: Strings

Program: Vet Visit Log & Symptom Checker

This program can help any people in knowing the right treatments and medical history of cats. Moreover, this helps to avoid further typing errors. It will make life easy.

```
In [17]: # Simple text variables
alert = "WARNING"
log = "    ID-67_symptom:limping_Rm305    "

# Using user input for cat's symptom
symptom = input("Enter a cat symptom: ")
symptom = str(symptom)

# Cutting off extra empty spaces from the left and right sides
log_record = log
log_record = log_record.strip()
symptom = symptom.strip()
print("Clean log record: " + log_record)

# Getting the first letter
first_letter = log_record[0]
print("First letter of log: " + first_letter)

# Cut out letters from position 2 up to position 4
part_of_log = log_record[2:4]
print("Log slice [2:4]: " + part_of_log)

# Combining the alert message and the symptom together
message = alert + "! Cat is " + symptom
print(message)

# upper() makes text uppercase. isalpha() checks if text is only letters.
print(symptom.upper())
print(symptom.isalpha())

# Checking if two text strings match exactly
if symptom == "coughing":
    print("Action Plan: Check lungs and breathing.")
elif symptom == "limping":
    print("Action Plan: Check legs and paws.")
else:
    print("Action Plan: Keep watching the cat.")

# Check if the user's symptom matches what is written in the Log record
if symptom in log_record:
    print("Match found! This symptom matches the database record.")

# Swapping the underscore symbol with a clean space
clean_log = log_record.replace("_", " ")
print(clean_log)

# Going through the symptom word letter by letter using a number counter
print("Looping with while:")
index = 0
while index < len(symptom):
    print(symptom[index])
    index = index + 1
```

Clean log record: ID-67_symptom:limping_Rm305
First letter of log: I
Log slice [2:4]: -6
WARNING! Cat is limping
LIMPING
True
Action Plan: Check legs and paws.
Match found! This symptom matches the database record.
ID-67 symptom:limping Rm305
Looping with while:
l
i
m
p
i
n
g

```
In [15]: ## Concepts that were used here:
# String type
# Indexing strings
# Read/Convert
# Looping through strings with while
# Slicing strings [2:4]
# Concatenating strings with +
# String operations
# String library
```

```
# String comparisons
# Searching in strings
# Replacing text
# Stripping white space
```
